

CS5002NI Software Engineering

35% Weightage Coursework

AY 2025- 26

Credit: 30

Student Name: Slesha Maharjan

London Met ID: 24046895

College ID: NP01CP4A240108@islingtoncollege.edu.np

Assignment Due Date: April 30, 2026 (6:00pm)

Assignment Submission Date: April 30, 2026

Word Count: 3969

I confirm that I understand my coursework needs to be submitted online via Google Classroom under the relevant module page before the deadline in order for my assignment to be accepted and marked. I am fully aware that late submissions will be treated as non-submission and a marks of zero will be awarded.

1. Introduction

Gokyo Bistro is a dining restaurant known for its indoor and outdoor ambience. Right now, the restaurant is operated manually and it has become difficult as more people are visiting. Sometimes the restaurant reaches full capacity, which makes customers unhappy and causes the restaurant to lose money. There is also a high demand for home delivery and table management.

To resolve this problem, the restaurant has decided to create an online management system. This project focuses on creating a restaurant management system using object oriented analysis and design. The system will be able to automate table reservation, order placement and beverage selection. By using this digital system, Gokyo Bistro can manage daily operations more efficiently, improve customer satisfaction, handle more delivery orders, and make better decisions for future planning and menu improvement.

1.1. Aim

The aim of this project is to design and implement a digital Restaurant Management System for Gokyo Bistro to improve its daily operations, customer service, and delivery management.

1.2. Objectives

- To automate table reservations and reduce waiting time for customers.
- To allow customers to pre-select beverages and place orders efficiently.
- To manage and track home delivery orders effectively.
- To provide data for better financial planning and menu optimization.
- To improve overall customer satisfaction and increase restaurant revenue.

2. Work Breakdown Structure and Gantt Chart

Work Breakdown Structure(WBS):

The process of dividing the tasks into a small productivity technique which is used to make the work more manageable and approachable is called work breakdown structure. (Anon., 2025).

Figure 1: WBS

In the given WBS, Azile methodology is used to divide the task. The work is divided into 6 parts: Product Backlog, Sprint Backlog, Sprint 1, Sprint 2, Sprint 3 and Sprint 4. The product backlog has all the requirement that is needed for the purpose of creating this system. The product backlog has two major parts, requirement gathering and discuss deadlines. The sprint backlog is the part where all the task will be divided for the sprint. It includes sprint planning, role assign , team assignment and test plan. Sprint 1 consists of authentication where the system for login and

registration will be made. Sprint 2 consists of Book Table and Set beverage choices where the system for booking and setting beverages will be made.

The sprint 3 consists of order placement and sprint 4 consists of payment and bill generation. Therefore, the work is divided for the Gokyo Bistro Management System.

3. Gantt Chart

Gantt chart is a horizontal bar chart which is used to visualize a project on a timeline. The gantt chart is made on the basis of WBS which is on Azile methodology. Here, the time for the completion of the system is decided and represented according to it.

Figure 2: Gantt Chart

4. Use Case Model

a. Use Case Diagram

Figure 3: Use Case Diagram

b. Use Case Description**i. High Level Use Case Description****1. Registration**

Use Case: Registration

Actors: Visitors

Description: A visitor is able to register to the account by providing all their credentials.

The system stores all the user credentials for future log in.

2. Login

Use Case: Login

Actors: Admin, Members

Description: A registered member and admin is able to log in into the system using username and password to the system. He/she provides the details and successfully logs into the system.

3. Book Table

Use Case: Book Table

Actors: Visitors, Members

Description: A user is allowed to check the availability of the tables and reserve a specific date and time. The system displays the available tables based on the selected schedule and confirms the reservation after validating the details.

4. Set Beverage Choices

Use Case: Set Beverage Choices

Actors: Visitors, Members

Description: A visitor is able to set the beverage choices while the members are able to reserve their wine/whiskey choices. The system is able to store the beverage choice of the visitor as well as store the wine/whiskey choices of the members.

5. Make Payment

Use Case: Make Payment

Actors: Visitors, Members

Description: A member and visitor is allowed to make a payment for reserving a table. The system requires an advance payment of 1200 to confirm the reservation. Users can choose different payment methods such as card, cash, or online payment. If the reservation is cancelled before the final day, the full amount will be refunded whereas if it is cancelled on the same day, 500 id deducted and the remaining amount is returned to the user

6. Generate Report

Use Case: Generate report

Actors: Admin

Description: Admin is able to generate the financial report. The system must have an advanced mechanism where admin will be able to predict the revenue for the future years. Also, the system shall be able to display recommendation of menu items.

7. Bill Generation

Use Case: Bill Generation

Actors: Admin

Description: The system is able to generate bill on the basis of total order placement. The user receives the bill whereas the admin is responsible for generating the bill.

8. Order Placement

Use Case: Order Placement

Actors: Visitors, Members

Description: Visitors/Members are able to place the food order according to their choices whereas the system is responsible to take the order and update according to it for the further functions.

9. Rate the Experience

Use Case: Rate the Experience

Actors: Visitors, Members

Description: Visitors/Members are able to rate the experience they had in the restaurant .
the system tracks the ratings

10. Post offers and schemes

Use Case: Post offers and schemes

Actors: Admin

Description: The admin is able to post offers and schemes . He/she is able to post various offers such as new year discounts or some special schemes for the benefit of the restaurant.

11. Update Menu

Use Case: Update Menu

Actors: Admin

Description: The admin is able to update the menu of the restaurant. He/she is able to make any changes in price or food description whenever it is necessary for the restaurant.

4.3.2. Expanded Use Case Description

i. Book Table

Use Case: Book Table

Actors: Visitors, Members

Description: A user is allowed to check the availability of the tables and reserve a specific date and time. The system displays the available tables based on the selected schedule and confirms the reservation after validating the details.

Typical Course of Events

User Action	System Response
1. The user selects the Book Table option.	
	2. Presents available date and time for reservation.
3. User selects date and time.	
	4. System shows available table for that slot.
5. User selects a specific table and no. of people.	
	6. System validates the table capacity and no. of people.
	7. System produces a confirmation message.

ii. Make Payment

Use Case: Make Payment

Actors: Visitors, Members

Description: A member and visitor is allowed to make a payment for reserving a table. The system requires an advance payment of 1200 to confirm the reservation. Users can choose different payment methods such as card, cash, or online payment. If the reservation is cancelled before the final day, the full amount will be refunded whereas if it is cancelled on the same day, 500 id deducted and the remaining amount is returned to the user.

Typical Course of Events

User Action	System Response
1. The user selects Make payment option in the system.	
	2. System displays the available payment methods: Cash, Card, Online
3. User selects a payment method.	
4. User provides the necessary payment details.	
	5. System verifies all the credentials
	6. System processes the payment.
	7. System confirms the payment and generates receipt.
8. User receives the receipt.	

5. Sequence Diagram

A sequence diagram is the visual representation of how objects in a system interact over time to execute a specific scenario or use case. In the above sequence diagram, payment function is taken.

First, the user (member or visitor) selects the payment option after placing an order or reserving a table. The request is sent to the system through the controller.

The controller then processes the request and asks the payment system to handle the transaction. Based on the selected payment method (online, card, or cash), the system performs the required steps such as validating card details or confirming cash payment.

After the payment is successfully completed, the payment system sends a confirmation back to the controller. The controller then updates the payment and bill information in the database.

Finally, a confirmation message is shown to the user, indicating that the payment was successful. If the payment fails, an error message is displayed instead.

Figure 4: Sequence Diagram

6. Activity Diagram

Activity diagram is a part of UML that helps to visualize workflows, processes or activity within the system. For the purpose of activity diagram, Book Table function is taken. The activity diagram consists of swim lane that is divided into user and system. The user section consists of user's activity whereas the system section consist of the activity done by the system.

*Figure 5: Activity Diagram*

7. Class Diagram

A class diagram is a type of UML diagram that shows the structure of a system. It represents different classes in the system along with their attributes and methods. It also shows how these classes are related to each other. Different symbols are used to represent class diagram.

- a. **Class:** A class is represented using a rectangle which is divided into three parts, class name, attributes and methods.

Figure 6: Class diagram

- b. **Attributes:** This part is written in the middle section of the class box such as customerName.
- c. **Methods:** The bottom section of the class shows the methods or functions such as placeOrder(), makeReservation.
- d. **Association:** It is the simple straight line between the classes that shows relationship like Customer places Order.
- e. **Composition:** It shows a strong relationship where one class cannot exist without the other class such as Bill and payment. It is represented by filled diamond.

Figure 7: Composition symbol

- f. **Aggregation:** It shows has a relationship where a class can exist independently. It is represented by unfilled diamond.

Figure 8: Aggregation symbol

- g. **Inheritance:** It shows that one class inherits properties of another class such as user inherits admin, member and visitors.

Figure 9: Inheritance symbol

Class Diagram

Figure 10: Class Diagram

8. Development Methodology

Agile Scrum was chosen for the development methodology of Gokyo Bistro project. This approach is suitable because it helps us address the urgent problem of restaurant in flexible way. With the increasing customer flow, the system may require continuous updates and improvements. By using this methodology, it becomes easier to make these changes step by step. Instead of waiting for months for the final product, the owners will be able to see the updates every fortnight which helps in getting feedback and making necessary improvements early.

a. Architectural choice

Software architecture is the process of expressing and defining a structural schema for any software system (AWS, 2020). For this system, microservices is chosen as the architectural style. Microservices is the approach of building the system in small independent programs, and new features can be added easily whenever needed.

Figure 11: Microservices

Here are some of the microservices in the Gokyo Bistro Management System.

Table 1: Microservices

Microservice	Purpose
User Service	It handles admin, visitor and member login, registration and access control.
Payment Service	It processes payment after the bill generation and ensures secure transactions.
Reservation Service	It allows customers to book tables and check availability.
Menu Service	It stores menu items like food, drinks, prices and availability.

Microservices is chosen over other architectures due to the following reasons:

i. Agility and Domain Ownership

Microservices allow us to divide the Gokyo Bistro system into small functions like book table and payment. Instead of creating the whole system at once, the team can focus on small operations and divide the tasks easily. This makes development faster and more manageable.

ii. Flexible Scaling for Peak hours

The main issue of Gokyo Bistro is the high number of customers during peak hours. Microservices help in this case because we can scale specific services like booking and order separately. This means the system can handle more users during busy time and still work properly.

iii. Reusable Service Modules

By treating functions as independent modules, we can reuse them across the Gokyo ecosystem. For instance, the User Service(which manages customer authentication) acts as the building block. If the bistro later decides to open a separate branch or loyalti mobile app, then they will be able to use the existing User and Payment services without writing the code from scratch.

b. Design Pattern

The design pattern chosen for the Gokyo Bistro is Model-View-Controller(MVC) design pattern. MVC pattern divides an application into three separate components that are Model, View and Controller.

Figure 12: MVC Design Pattern

This helps in the improvement of organization, maintainability and scalability of the system. The benefits of using this model in this system are given below:

Independent Development

MVC pattern allows the system to be developed and modified without affecting one another. For instance, in Gokyo Bistro, the frontend developers might work on the UI part and the backend developers might work on the database queries. This helps in the independent development of the system.

Isolate changes for Improved Maintainability

MVC pattern helps in the improvement of the system by isolating changes to specific components over long term. In the system, if they decide to change their payment

provider from esewa to khalti, then the developers only need to modify the controller and a small part of the model. This helps in the prover improvement of the system.

Simplifies testing by separating business logic from the user interface

In MVC, the model is completely independent of the view. This allows the team to perform testing on critical backend rules without needing to load the website \. This helps in systematically testing without interfering in the user interface.

c. Development Plan

To successfully execute the Gokyo Bistro project, it is very important to select right tools that ensure good performance and smooth development. The chosen technical stack is explained below along with the reasons for the selection and how will it help building the system.

i. Frontend: React.js

React.js which is basen on Javascript is chosen for creating an interactive user interface. The system includes of features like table reservation and order placement where a responsive UI is very important. Javascript helps in creating a dynamic with smooth navigation and responsive user interface. React also allows updating only required parts of the page without reloading, which improves user experience. This makes the system faster and easier to use both customers and admin.

Figure 13: React logo

ii. Backend: Java

Java is selected for the backend to ensure multiple handling of the users at the same time. This helps in managing complex business logic such as ensuring that tables are not double booked during high customer surge, while maintaining good security and speed. It also supports strong database connectivity(JDBC), which makes data handling easier. Overall, this ensures the system runs smoothly without crashes or data issues.

Figure 14: Java Logo

iii. Database: SQL and phpMyAdmin

The combination of SQL and phpMyAdmin is chosen for the purpose of database. SQL is used to manage and store all the data such as customer details, reservations, orders and payments. phpMyAdmin is chosen as it provides an easy interface to manage database without writing complex queries every time. By combining both of these helps in organizing data properly reducing errors and making data retrieval faster , which is important for real time operations in the restaurant.

Figure 15:MySQL and phpMyAdmin

iv. Collaboration: Github

Github is used for team collaboration in this project. To complete the project in a mannered way, github plays an important role for team collaboration. All the changes in the github can be tracked and the previous versions can be tracked using it. This helps the team to work together smoothly and maintain the project effectively throughout the development process.

Figure 16: Github

d. Testing Plan

Software Testing Lifecycle(STLC) is a structured process to define the involded steps during the testing of the product. In the project, STLC will run in parallel with our development.

Table 2: STLC

Phase	Description	Used in System
Requirement Analysis	The QA team understands what needs to be tested.	Identifying the physical table status in Jhamshikhel and the digital database as high priority test requirement.
Test Planning	The test strategy and the plan for the whole testing is created.	Planning to split tests for white box testing and black box testing.
Test case Development	The detailed test cases and necessary test data are prepared.	Creating a specific test case for a function such as booking table 5 and then the status changes to occupied in the system.
Test Environment Setup	Checks the hardware, software and network conditions under which testing will be executed.	Managing the server of the Gokyo Bistro so that the server does not black out during massive surge of customers.
Test Execution	Test cases are executed in the defined environment.	Executing Black Box test and White Box test on the individual sprint.
Test Closure	Final stage where the testing activities are	Ensuring the book table function are working

	completed and documented.	properly and ready to be deployed.
--	---------------------------	------------------------------------

White Box Testing

White box testing is a testing method that focuses on examining the code logic, flow and implementation of the application. Here are some of the test cases that can be done in the white box testing:

Table 3: White Box Testing

Scenario	Target	Internal Logic Check
A user tries to book table for 6 people but only 5 seats are available in the restaurant.	BookService.validateAvailability()	It checks whether the code logic trigger the function or not and returns specific exception error or not.
A user tries to login with the admin dashboard.	AdminSecurityConfig.java	It checks whether the function that authorizes and give access is working properly or not by ensuring that only authorized admin can enter.

Black Box Testing

Black box testing is the technique for testing where the tester checks the application without any internal code but just the functionality. Here are some of the test cases that can be done for black box testing:

Table 4: Black Box Testing

Scenario	Expected Result
A user tries to book table for 6 people but only 5 seats are available.	The system should not allow booking for 6 people and display appropriate message for it
A normal user tries to login to the admin dashboard.	The system should deny the access and prevent the user from entering the admin dashboard.

e. Maintenance Plan

Maintenance plan is the process that ensures that the system will be working properly after the system is developed and deployed. There are four types of maintenance plan and they are:

1. Corrective Maintenance

This process is used to maintain and fix the bugs and error once the system is deployed. Taking an example, a customer faced a problem while making an online payment. This helps to quickly fix the problems ensuring smooth operation of the system.

2. Adaptive Maintenance

This is the process of making changes in the system with the change in system environment such as software updates or new devices. This helps the system stay compatible with new updates and ensure that it will run properly in the changing conditions.

3. Perfective Maintenance

This is the process of maintenance that focuses on improving the existing features and adding new functionalities based on the user feedback. For example if the restaurant

wants to add new feature like home delivery then it can be easily added which ensures user experience.

4. Preventive Maintenance

This is the process of regularly monitoring the system and identifying the bugs as soon as possible and fixing them. This helps in avoiding crashes and improves the overall performance of the system.

Likewise, additional things can be done for the maintenance of the system.

- Regular system monitoring can be done to check performance and detect any issues early.
- Regular backup of the data such as orders, reservations and customer details can be done to prevent data loss.
- All the changes can be pushed in git so that any further updates can be maintained.

9. Conclusion

In conclusion, we have developed the Gokyo Bistro Management System using various methodologies and approaches. The system is designed to improve and simplify restaurant operations such as ordering, reservations, billing, and customer management. It has been developed to create an efficient, reliable, and user-friendly system that supports smooth restaurant operations. Overall, this system helps in improving performance, reducing manual work, and ensuring better service for customers and staff.
